

western blotting tools

EXPLORE OUR PRODUCTS DESIGNED TO IMPROVE EACH STEP OF THE WESTERN BLOTTING WORKFLOW.

Western blotting (also known as immunoblotting) is one of the most commonly used techniques in the lab, yet difficulties persist in obtaining consistent, quality results. At Merck, we've been helping scientists perform their Western blots for decades, with continuous problem-solving and steadfast technical support.

With legacy products from Millipore and Sigma-Aldrich, our catalog includes thousands of trusted products for Western blotting on which protein detection experts rely, including Roche cOmplete protease inhibitor cocktails, Immobilon® PVDF and Amersham™ Protran nitrocellulose transfer membranes, and ECL detection substrates. We never stop working to find innovative solutions that improve immunoblot reliability, speed, sensitivity, and quantitative potential to get you to publishable results in time, every time.

Access to our Western blotting expertise is easy—flip to our troubleshooting section at the end of this brochure, or learn more at:

protein extraction & sample preparation

Experts agree that protein extraction and purification represent the first of many challenges in obtaining a quality lysate or purified protein sample that delivers publication-quality Western blot results. Our quality reagents unite superior performance with speed to reduce exposure of proteins to unfavorable conditions, leading to more stable, intact proteins for downstream analysis.

Best practices for protein extraction and preparation:

- Extract using a fractionation technique suitable for your cell type, tissue, or organism.
- Protect samples from degradation by endogenous proteases and phosphatases with relevant enzyme inhibitors.

Extraction kits and protease inhibitors

Protein stability is fundamental to all aspects of protein research, including analysis by Western blotting. Combine our gentle protein extraction kits with protease inhibitors to obtain stabilized, intact and active proteins.

- Nonmechanical extraction using BugBuster® or CytoBuster™ kits and reagents provides a simple and rapid release without denaturing soluble proteins.
- Pair with SIGMAFAST™ or Roche cOmplete® inhibitor tablets to ensure maximum yields of stabilized and intact proteins.
- Add Benzonase[®] nuclease to degrade nucleic acids and reduce viscosity of cellular extracts.
- Use Stabilyser[™] reagent and protect both nucleic acids and functional proteins in one uniform lysate mixture.

Our complete range of extraction kits and reagents provide you with an array of options so that you can construct the perfect extraction protocol for your specific cells or tissue and protein of interest.

Affinity purification

Affinity purification is based on the specific interaction of a target molecule with an immobilized ligand. We offer a wide range of tools for protein purification, including affinity magnetic beads, affinity agarose resins, and protease cleavage enzymes. To ensure that samples are enriched for protein(s) of interest, our depletion reagents eliminate common irrelevant, abundant proteins that may confound protein analysis.

- PureProteome[™] magnetic beads are ideal for small volume affinity purification assays, such as immunoprecipitation and serum depletion or enrichment.
- Affinity agarose formats are suited for larger volume applications, such as antibody or recombinant protein purification.
- Protease cleavage enzymes are available in restriction grade or in kits for cleaving fusion proteins.

Buffer exchange and concentration

Simultaneously concentrate and desalt your samples with Amicon® Ultra centrifugal filters. Their unparalleled rapid and reproducible performance minimizes protein exposure to harsh buffers. For fast and easy dialysis, use D-Tube™ Dialyzers, which provide >89% recovery and 99.9% desalting in as little as two to five hours.

protein quantitation

QuantiPro™ BCA Assay Kit

Kit provides components to measure very dilute protein concentrations in small sample volumes.

 Accurately measures protein concentrations from 0.5 to 30 μg/mL in tube assays and 1 to 20 μg/mL in 96- or 384-well plate assays

Bradford Reagent

The Bradford assay is based on the complexing of proteins with Brilliant Blue G.

- The reagent is ready-to-use no mixing or dilution required
- Color development is rapid. Incubate for five minutes; then read the sample at 595 nm
- Does not interfere with reducing sugars, reducing substances, or thiols
- Reagent is suitable for micro (1–10 μg/mL) and standard (50–1400 μg/mL) assays

BLUEye Prestained Protein Ladder

The ready-to-use BLUeye prestained protein ladder has 12 sharp bands at 11, 17, 20, 25, 35, 48, 63, 75, 100, 135, 180, and 245 kDa – more bands than commonly used markers. Provided in a gel loading buffer, a green and a red reference band enable easier identification.

electrophoresis

Electrophoresis is the technique most commonly used to separate extracted proteins for Western blot analysis. Applying an electrical current to a gel causes the proteins within the sample to migrate at different rates and separate within the medium according to their inherent properties. In the most common method, sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE), proteins separate according to their molecular weights. Attributes such as gel chemistry, running conditions, and acrylamide percentage can affect protein migration and should be considered in order to optimize results.

Best practices for electrophoresis

Select Gel & Buffer	Determine the gel electrophoresis system that is appropriate for your protein sample and targeted analyte, including acrylamide concentration and running buffer.
Prepare Sample	For SDS-PAGE, samples are treated with sodium dodecyl sulfate, which denatures the protein and equilibrates the charges across samples. Reducing agents, such as dithiothreitol (DTT) should be added to samples that contain proteins with disulfide bonds.
Load	Always load control samples (positive, negative, etc.) to ensure reliability of results. Consider published kDa of target when choosing a molecular weight marker to estimate protein size and monitor mobility progress and transfer efficiency.
Stain	Following electrophoresis, the gel can be stained in order to visualize and confirm successful migration of proteins.

TruPAGE™ Precast Gels & Buffers

- Durable to resist tearing during experimental handling
- Compatible with popular electrophoresis equipment
- Deep wells with teeth that protrude above the backplate of the gel cassette, increasing well capacity and decreasing lane-to-lane overflow
- Extended shelf life means gels last up to 2 years from the date of manufacture when properly stored
- Fast Run times as short as 30 minutes
- Affordable Gels and buffers offer a cost-saving alternative without compromising performance and experimental integrity

How do Immobilon® membranes work?

Membranes bind biomolecules through hydrophobic (polyvinylidene fluoride (PVDF)) or electrostatic (cellulose-based membranes) interactions. Membrane pores increase the surface binding area while restricting sizes of bound proteins.

Key Benefits

- Stronger protein signals due to high adsorption & retention of protein in the membrane
- Prolonged shelf life due to higher tensile strength
- Easier stripping & reprobing with PVDF membranes
- A variety of pore sizes provides optimal protein retention

Membranes are 3-dimensional structures full of microscopic pores (Scanning electron microscope image of a cross-section of Immobilon®-P Membrane, Magnification: 500x).

Immobilon®-P membrane transillumination for stain-free protein visualization, comparison to other stains

After transfer, proteins may be visualized by a variety of methods. If Immobilon® membranes are used, proteins may be visualized directly via the transillumination method (Reig and Klein, 1988). Detection sensitivity is comparable to Coomassie Brilliant Blue R stain when this method used in conjunction with an imaging system.

Calf liver proteins are visualized after electroblotting to Immobilon®-P membranes: (A) Transillumination, (B) Coomassie Brilliant Blue, (C) Ponceau-S red, (D) Amido black and (E) CPTS total protein stains. Left to right, molecular weight standards and 12.2 µg, 6.1 µg, 3.1 µg of the lysate per lane. For a detailed protocol, please refer to our Protein Blotting Handbook.

Immobilon® NOW Transfer Membrane rolls for Western blotting The convenience of pre-cut sheets with the flexibility of rolls

With standard rolls of transfer membrane, plan for extra bench time with ruler and scissors to cut the size needed for your experiment. Over time, this handling leads to waste of your valuable membrane. Pre-cut sheets offer convenience, but are costly and lack flexibility if a different size is needed.

Until NOW!

Immobilon® NOW rolls offer the convenience of precutsheets with the flexibility of rolls in the formats you depend on: Immobilon®-E, Immobilon®-P, Immobilon®-FL and Immobilon®-PSQ membranes.

- 1-cut convenience
- Flexibility for mini or midi blots
- · Measurement marks on the lid. No ruler needed!
- No waste
- Smaller package saves space in your lab

The optional Immobilon® NOW Dispenser adds even more convenience. It offers a complete solution to measure, cut and store the transfer membrane. Simply retract the unused membrane into the container and easily see when to refill.

Immobilon®-E Transfer Membrane

No alcohol pre-wet step required!

Unlike other PVDF transfer membranes, Immobilon®-E membrane does not require an alcohol pre-wet step prior to Western blotting. It wets out easily with standard transfer buffers or even water. Experimental results are similar to Immobilon®-P membrane.

- Shorter workflow than other PVDF membranes
- Less organic waste
- Immobilon® performance

VDF performance with the workflow of nitrocellulose

Serial dilutions of EGF-stimulated A431 cell lysate (12-110) were separated via SDS-PAGE. Proteins were transferred from a single polyacrylamide gel to strips of Immobilon®-E, Immobilon®-P and nitrocellulose membranes. All three membranes were processed identically for immunodetection using a single tray. Membranes were blocked with 3% non-fat dry milk and then probed with antibodies to HSP70 (SAB4200714) and GAPDH (MAB374). Target proteins were visualized using anti-mouse HRP (AP124P) at 1:40,000 dilution followed by development with Immobilon® Classico Western HRP Substrate (WBLUC0500).

Immobilon®-P^{SQ} transfer membrane for smaller proteins

Publications citing Immobilon®-PSQ Membrane: ~750

How do Immobilon®-PSQ membranes work?

This PVDF membrane has a thickness of ~200 μm and approximately 3 times the internal surface area of most membranes. These properties give Immobilon®-P^{SQ} higher protein binding capacity, improving retention of small proteins.

Key Benefits

- Higher binding capacity and retention resulting in stronger signals
- Prevents blow-through of low molecular weight proteins (<20 kDa)
- Compatible with chemiluminescent and fluorescence detection techniques

Ideal for:

- 1. Westerns involving lysates or small proteins (<20 kDa), such as histones
- 2. Difficult Westerns due to:
 - Low-abundance target proteins
 - · Low-affinity antibodies

Scanning electron microscopy images (3000x magnification) differences in pore structure in the Immobilon®-P^{SQ} membrane (right) relative to Immobilon®-P membrane (left).

Immobilon®-P^{SQ} membrane prevents low MW proteins from blowing through the membrane, increasing protein signal. Molecular weight standards (lanes 1 and 3) and calf liver lysate (lanes 2 and 4) were transferred to Immobilon®-P or Immobilon®-P^{SQ} membranes. A sheet of Immobilon®-P^{SQ} membrane was placed behind the primary membranes to capture proteins that passed through (lanes 5 and 6 behind Immobilon®-P membrane; lanes 7 and 8 behind Immobilon®-P^{SQ} membrane).

Immobilon®-FL transfer membrane

Publications citing Immobilon®-FL Membrane: ~9,000

Why choose Immobilon®-FL Membrane over other membranes for fluorescent Westerns?

This 0.45 µm-pore membrane is the first transfer membrane specifically optimized for fluorescence-based detection of Western blots. Its extremely low background autofluorescence improves sensitivity of all fluorescence detection protocols.

Key Benefits

- The best membrane for near-infrared wavelengths (700-800 nm)
- Strong signals due to higher protein adsorption and retention on the membrane
- Low background to detect even faint bands
- High tensile strength for multiple stripping and reprobing cycles

blocking & antibody incubation

SNAP i.d.® 2.0 protein detection system for Western blotting.

SNAP i.d.® 2.0 Protein Detection System

Unlike conventional Western blotting, where diffusion is the primary means of reagent transport, the SNAP i.d.® 2.0 system applies a vacuum to actively drive reagents through the membrane. This innovative technology promotes antigen binding and thorough washing, enabling you to better optimize your Western blotting conditions.

How does the SNAP i.d.® 2.0 system reduce background? Traditional immunodetection relies on the slow diffusion of reagents into and out of the blot, leading to long incubation times and possible high background. The SNAP i.d.® 2.0 system actively pulls working solutions through the membrane for maximum interaction of antibodies with targeted antigens and high efficiency in blocking and washing that reduces nonspecific binding.

How does the SNAP i.d.[®] 2.0 system work?

The vacuum-driven SNAP i.d.® 2.0 system takes full advantage of three-dimensional reagent distribution and reduces immunodetection time from hours to minutes using the following mechanisms:

- 1. The system increases local antibody concentrations at binding sites by using vacuum filtration, driving the antibody-antigen binding reaction forward and shortening incubation times.
- 2. Vacuum pulls any residual, unbound antibody out of the membrane, reducing nonspecific binding that leads to background signal.

Key Benefits

- Faster results
- Reduces antibody optimization time
- Increases daily Western blot throughput

Key Features

- Fastest immunodetection on the market
- · Increased antibody-antigen binding
- Superior washes for lower background
- Save antibody by collecting and reusing your solutions

SNAP i.d.® 2.0 system in the Western blotting workflow Immunodetection in as little as 30 minutes!

Immobilon® Signal Enhancer

New Immobilon® Signal Enhancer combines signal amplification and blocking in one ready-to-use reagent.

Boost signal: Amplify low-intensity signal in Western blots-without amplifying noise

Save primary antibody: Use Immobilon® Signal Enhancer to reduce the amount of valuable primary antibody required

Blot A: 5% non-fat dry milk, anti-Akt antibody diluted 1:5,000

Blot B: Immobilon®

More signal. Less antibody. Blot A: 5% non-fat dry milk in TBST was used for blocking and antibody dilutions. Anti-Akt antibody was diluted 1:5,000. Blot B: Immobilon® Signal Enhancer was used for blocking and antibody dilutions. The amount of primary antibody was reduced ten-fold, allowing it to be used at a dilution of 1:50,000.

5 μg 2.5 μg 1.3 μg 0.6 μg

Immobilon® Signal

5 μg 2.5 μg 1.3 μg 0.6 μg

Two-fold dilution series of EGF-stimulated A431 cell lysate were resolved by SDS-PAGE and transferred onto Immobilon®-P or Immobilon®-FL membrane. Blots were blocked with either 5% non-fat dry milk or Immobilon® Signal Enhancer. Primary antibodies (rabbit anti-Akt, Cat. No. 05-796 and mouse anti-PKC antibody, Cat. No. 05-983) and the labeled secondary antibodies were diluted in the respective reagents at identical dilution ratios. All blots were compared under the same conditions.

Immobilon® Block Noise cancelling reagents

In Western blotting, blocking of unbound membrane sites is necessary to prevent the non-specific binding by antibodies that leads to high backgrounds.

Traditional milk/protein-blockers can leave a thick layer of sticky proteins that:

- Reduce the sensitivity or detection by masking the signal.
- Are not compatible with detection of protein phosphorylation due to the presence of phosphoproteins in milk.

Immobilon® Block Reagent Key Benefits

- Reduced background for better protein detection
- No need to run a second gel for Coomassie staining
- Stable at room temperature for 2 years
- · Ready to use, no mixing required

Immobilon® Block reagents excel with diverse antibodies and lysates

Relative Protein Abundance

All primary and secondary antibodies were diluted in Bløk®-CH

Immobilon® Block-CH noise cancelling reagent

Chemiluminescence Immobilon® **Detection (anti-phos-Blot Stained Supplier P NFDM Block-CH** photyrosine) after Detection 2 4 5 2 3 3 6

Immobilon® Block reagents provide better signal-to-noise ratios compared to NFDM or blocking reagents from Supplier P. Chemiluminescence detection of p53 in EGF-stimulated A431 lysate (10–2.5 μ g/lane). Blocking reagents indicated were used during the blocking and antibody incubation steps. NFDM = nonfat dry milk.

Immobilon® Block reagents enable Coomassie blue staining of membrane after immunodetection. A blot containing freshly prepared samples of A431 cell lysates (lanes 2–4) and old samples (lanes 5–6), normalized to 10 µg of total protein per lane. The blot was blocked with Bløk®-CH reagent probed with antiphosphotyrosine, clone 4G10®, and detected by chemiluminescence (left panel). Lanes 5 and 6 showed significantly lower signal than lanes 3 and 4. Staining the membrane with Coomassie blue immediately after immunodetection ruled out the possibilities of loading and transfer errors.

Technique Spotlight

Immobilon® Block-PO noise cancelling reagent

Blocking of non-specific protein binding sites on a blot is essential to decreasing the background and obtaining meaningful results. Although milk is the most commonly used blocker, the presence of phosphorylated mammalian proteins in milk can results in a very high background. For that reason, non-protein based blockers are ideal for immunoblotting for phosphorylated proteins.

How does Bløk®-PO reagent improve results?

This chemical-based blocker contains phosphatase inhibitors to preserve the phosphorylation state of the blotted proteins.

Key Benefits

- Protein-free for reduced background and better detection
- Contains phosphatase inhibitors to keep phosphorylated sites intact
- No need to run a second gel for Coomassie staining.
- Stable at room temperature for 1 year
- Formulated for immediate use

Chemiluminescence detection of pERK in EGF-stimulated A431 lysate (serial dilution ranging from 10–2.5 μ g/lane, Cat. No. 12-110). Blots were blocked in the specified reagent (above) then probed with anti-pERK antibody (1:10,000, Cat. No. 05-797R) diluted in the respective blocking buffer. Bands were detected using Immobilon® Forte Western HRP substrate (Cat. No. WBLUF0500). NFDM= Non-fat dry milk.

Immobilon® Block-FL noise cancelling reagent

Key Benefits

- Specially formulated for reduced background on fluorescent westerns
- Ready to use straight from the bottle
- Stable at room temperature for 2 years
- Enables colorimetric staining of blots after immunodetection

Avoid running a gel just for Coomassie staining

The combination of Immobilon® Block Noise Cancelling Reagents and Immobilon®-PVDF membranes enable membrane staining after immunodetection.

Immobilon® Block-PO reagent works best for detection of phosphoproteins.

Fluorescence detection: Dilution series of EGF stimulated A431 lysate (20–2.5 μ g/ lane,Cat. No. 12-110) were resolved by SDS-PAGE and transferred onto Immobilon®-FL membranes. The blots were blocked, probed with either anti-phosphoserine antibody, clone 4A4 (1:400, Cat. No. 05-1000) (upper panel) or antiphosphotyrosine antibody, clone 4G10® (1:400, Cat. No. 05-321) (lower panel), diluted with respective blocker, followed by anti-mouse IgG antibody IRDye800 conjugated (1:1,000, Cat. No. 926-32210, LI-COR). The blots were scanned on the Odyssey® scanner (LI-COR) after vacuum drying for 1 hour.

A blot containing different samples of A431 cell lysate, some freshly prepared (lanes 2-4) and some old samples (5-6), were normalized to 10 µg of total protein per lane (left panel). The blot was blocked with Immobilon® Block-FL reagent and probed with anti-phosphotyrosine, clone 4G10®, and detected by fluorescence. Lanes 5 and 6 showed significantly lower signal than lanes 3 and 4 with both detection methods. Staining with Coomassie blue immediately after immunodetection ruled out the possibilities of loading and transfer errors.

Immobilon® Block-FL reagent provides enhanced signal-tonoise ratio for optimized fluorescent Western blot results. Two Immobilon®-FL blots with dilution series of EGF-stimulated A431 lysate (2-0.5 µg/lane, lysate Cat. No. 12-110) were blocked with the indicated blocker and probed with either anti-GAPDH antibody (top)1:10,000, Cat. No. MAB374) or anti-Actin antibody (bottom) (1:2,000, Cat. No. MAB1501) diluted in the indicated blocker. Following probing with secondary anti-mouse IgG antibody IRDye680 (top) or IRDye800 (bottom) the blots were scanned on the Odyssey® scanner (LI-COR) after vacuum drying for 1 hour.

Technique Spotlight

Phosphospecific antibodies

Merck's extensive portfolio of antibodies includes over 600 validated, phosphospecific antibodies. These antibodies are critical tools for the exploration of biological pathways and signals that involve phosphorylation.

Anti-phospho-MYPT1 (Thr696) (Cat. No. ABS45)

Myosin phosphatase target subunit 1 (MYPT1) regulates the interaction of actin and myosin downstream of the guanosine triphosphatase Rho, which inhibits myosin phosphatase via Rho-kinase. Inhibition of myosin light chain phosphatase, via phosphorylation of MYPT1, results in Ca2+ sensitization of smooth muscle contraction. MYPT1 is localized on stress fibers, and is distributed close to the cell membrane and at cell-cell contacts to regulate myosin phosphatase activity.

Description	Qty.	Cat. No.
Anti-Phosphotyrosine, clone 4G10	100 µg	05-321
Anti-phospho-Histone H2A.X (Ser139)	200 µg	05-636
Anti-phospho-CREB (Ser133)	100 µL	06-519
Anti-phospho-Smad2, (Ser465/467)	100 µL	AB3849
Anti-phosphoserine, clone 4A4	100 µg	05-1000
Anti-phospho-ACK1 (Tyr284)	100 µL	09-142
Anti-phospho-ATM (Ser1981), clone 10H11.E12	200 µg	05-740
Anti-phospho-MYPT1 (Thr696)	200 µg	ABS45
Anti-phospho-Src (Tyr416), clone 9A6	100 µg	05-677
Anti-phospho-GluR1 (Ser845), clone EPR2148	100 µL	04-1073

Western blot detection of phospho-MYPT1. Lysates of NIH3T3 cells +/- calyculin/ okadaic acid were resolved by electrophoresis, transferred to PVDF membranes and probed with Anti-Phospho-MYPT1 (Thr696) (1:1,000) on the SNAP i.d.® system. Proteins were visualized using a Donkey anti-Rbt IgG:HRP conjugate and visualized using chemiluminescence detection. Arrow indicates Phospho-MYPT1 (Thr696) (~130 kDa).

Detection of phospho-Histone H2A.X in cells undergoing DNA damage. Jurkat cells were treated with the cytotoxic agent, etoposide, and stained with Anti-phospho-Histone H2A.X (Ser139, Cat. No. 05-636), clone JBW301 (green, right panel); DNA stained with DAPI (left panel).

Loading control antibodies for Western blotting

Proteins that exhibit abundant, constitutive levels in the Western blot sample can be used to control for technical variability. These so-called loading controls are essential for confirming that differences in observed signal in Western blot experiments are caused due to changes in protein expression, and not to artifacts introduced during sample loading, transfer and other workflow steps.

Although a few key so-called "housekeeping" proteins have sometimes been used as default loading controls, it is important to consider the characteristics of the target protein as well as experimental conditions of your Western blot assay.

Factors that should influence selection of an antibody against a loading control protein include:

- Constitutive expression of the loading control protein in the sample of interest
- A molecular weight dissimilar from that of the target, so that bands may be resolved
- Linear signal at the amount of lysate loaded in each gel lane
- Antibody validated for use in Western blot

Evaluation of signal linearity for prospective loading controls

Western blot of ERK1/2, GAPDH, and HSP70 shows the linear range of quantitation for each protein for the same sample. Cell line source for lysate, A431, Cat. No. 12-110. (x-GAPDH, Cat. No. MAB374; x-HSP70, Sigma SAB4200714; x-Erk1/2, Merck 06-182*) (ECL reagent, Immobilon® Classico Western HRP substrate, Cat. No. WBLUC0500).

Anti-PCNA, polyclonal	Hu, Ms, Rt, Chp	Rb	35 kDa	07-2162

detection

Chemiluminescent substrates for Western blotting

We offer a broad selection of ECL (enhanced chemiluminescence) substrates for every application.

Immobilon® Classico, Crescendo and Forte substrates are a family of premixed reagents for peroxidase-based detection that offer significant advantages over other ECL reagents:

- Single component, ready-to-use formulations simplify detection for enhanced reproducibility and convenience
- A range of sensitivities to provide optimal signalto-background ratio across a spectrum of target protein concentrations

Immobilon® HRP substrates deliver exceptional sensitivity and long signal life in standard 2-component formats. These formulations permit the use of more dilute primary antibody solutions for immunoblot detection. Our newest product, Immobilon® ECL Ultra substrate, provides sensitivity at the low femtogram range with longer signal duration than other substrates in its class.

Primary Antibody Dilution	R	ela	tive	e S	ens	siti	vit	y of Chemiluminescent Sul	ostrates
1:100,000	1.5	2	-	12	25	50	100	Immobilon® ECL Ultra HRP Substrate	2-component reagents

Test Immobilon® substrates AFTER your regular HRP substrate

We've tested the Immobilon® substrates after using other commercial HRP substrates on the same blot and found no significant differences in band intensity compared with detecting with Immobilon® substrates alone. Try it, and you may detect bands you were not able to visualize previously.

Visualized with specified HRP substrate

Immobilon® Classico Competitor P Competitor G Lysate, µg Competitor P Competitor C Competitor P Competitor C

Revisualized with Immobilon® Classico

Reprobing blots with weak signal resulting from other HRP substrates with more sensitive reagents like Immobilon® Classico can improve signal intensity

Detection of GAPDH. Three Western blots containing a 2-fold dilution series of A431 extract (ranging from 2 μg–0.06 μg) were probed with 1:1000 dilution of anti-GAPDH (Cat. No. MAB374) and 1:1000 dilution of anti-mouse HRP-conjugated secondary antibody (Cat. No. AP124P) using a SNAP i.d.® system. Blots were first visualized with the indicated HRP substrate, then blots 2 and 3 were washed and re-visualized with Immobilon® Classico substrate. All blots were exposed to X-ray film for 1 minute.

Obtain the best Western blots possible using Immobilon® Western HRP substrates

When no bands were detected with Immobilon® Classico Western HRP substrate (boxed blot), two solutions were considered:

- 1. Test a more sensitive reagent, such as Immobilon® Crescendo or Forte substrate
- 2. Increase antibody concentration from 1:10,000 to 1:1,000

Using higher sensitivity HRP substrates produced the best results and was beneficial in three ways:

- 1. Better results: The increased-sensitivity detection reagent produced stronger bands for a more quantitative blot (compare the increase in band intensities for Immobilon® Crescendo & Forte substrates at 1:10,000 dilution).
- 2. Faster: It took only 10 minutes to wash the blot and apply a new substrate compared with 2.5 hours required to repeat antibody incubations.
- 3. Reduced cost: Appropriate selection of HRP substrates costs less than increasing the concentration of antibody.

Immunoblots of the indicated amounts of A431 lysate were probed with different concentrations of anti-GAPDH antibody (Cat. No. MAB374) indicated, followed by an appropriate secondary antibody. Bands were visualized using the indicated Immobilon® HRP substrate and exposed to x-ray film for 5 minutes.

ReBlot™ Plus Western blot recycling kit

Publications citing ReBlot™ Plus: ~2,900

This quick stripping reagent is the product of choice for regenerating Western blots.

What is ReBlot™ Plus?

ReBlot™ Plus reagents efficiently strip probed blots of bound antibodies. ReBlot™ Plus reagents are available in "Mild" and "Strong" formulations.

- Re-Blot™ Plus Mild Stripping Solution Provides good results on both nitrocellulose and PVDF membranes.
- Re-Blot[™] Plus Strong Stripping Solution Performs when membranes with high signal are to be stripped, or use when Re-Blot[™] Plus Mild treatment is not sufficient.

Key Benefits

- β-Mercaptoethanol-free to avoid pungent odors
- Room temperature stripping in just 15 minutes
- · Fast reuse of blots for multiple antibody probings
- Non-acidic, for reduced risk of protein degradation (such as in Edman degradation)

Troubleshooting Western blots

Symptom	Possible Cause	Remedy
Immunodetection		
Weak signal	Improper blocking reagent	The blocking agent may have an affinity for the protein of interest and thus obscure the protein from detection. Try a different blocking agent and/or reduce both the amount or exposure time of the blocking agent.
	Insufficient antibody reaction time	Increase the incubation time.
	Antibody concentration is too low or antibody is inactive	Multiple freeze-thaws or bacterial contamination of antibody solution can change antibody titer or activity. Increase antibody concentration or prepare it fresh.
	Outdated detection reagents	Use fresh substrate and store properly. Outdated substrate can reduce sensitivity.
	Protein transfer problems	Optimize protein transfer.
	Dried blot in chromogenic detection	If there is poor contrast using a chromogenic detection system, the blot may have dried. Try rewetting the blot in water to maximize the contrast.
	Tap water inactivates chromogenic detection reagents	Use Milli-Q [®] water for reagent preparation.
	Azide inhibits HRP	Do not use azide in the blotting solutions.
	Antigen concentration is too low	Load more antigen on the gel prior to the blotting.
No signal	Antibody concentration too low	Increase concentration of primary and secondary antibodies.
	HRP inhibition	HRP-labeled antibodies should not be used in solutions containing sodium azide.
	Primary antibody was raised against native protein	Separate proteins in non-denaturing gel or use antibody raised against denatured antigen.
Uneven blot	Fingerprints, fold marks or forceps imprints on the blot	Avoid touching or folding membrane; use gloves and blunt end forceps.
Speckled background	Aggregates in the blocking reagent	Filter blocking reagent solution through 0.2 μm or 0.45 μm Millex® syringe filter unit.
	Aggregates in HRP-conjugated secondary antibody	Filter secondary antibody solution through 0.2 μm or 0.45 μm Millex® syringe filter unit.
High background	Insufficient washes	Increase washing volumes and times. Pre-filter all of your solutions including the transfer buffer using Millex® syringe filter units or Steriflip® filter units.
	Secondary (enzyme conjugated) antibody concentration is too high	Increase antibody dilution.
	Protein-protein interactions	Use Tween®-20 detergent (0.05%) in the wash and detection solutions to minimize protein-protein interactions and increase the signal to noise ratio.
	Immunodetection on Immobilon®-P ^{SQ} transfer membrane	Increase the concentration or volume of the blocking agent used to compensate for the greater surface area of the membrane. Persistent background can be reduced by adding up to 0.5M NaCl and up to 0.2% SDS to the wash buffer and extending the wash time to 2 hours.
	Poor quality reagents	Use high quality reagents and Milli-Q® water.
	Crossreactivity between blocking reagent and antibody	Use different blocking agent or use Tween®-20 detergent in the washing buffer.
	Film overexposure	Shorten exposure time.
	Membrane drying during incubation process	Use volumes sufficient to cover the membrane during incubation.
	Poor quality antibodies	Use high quality affinity purified antibodies.
	Excess detection reagents	Drain blots completely before exposure.

28 TROUBLESHOOTING

Troubleshooting Western blots

Symptom	Possible Cause	Remedy
Immunodetection (co	ntinued)	
Persistent background	Non-specific binding	Use High Salt Wash. (PBS or TBS supplemented with 0.5% NaCl and 0.2% SDS)
High background (rapid immunodetection)	Membrane wets out during rapid immunodetection	Reduce the Tween®-20 detergent (<0.04%) detergent in the antibody diluent.
		Use gentler agitation during incubations.
		Rinse the blot in Milli-Q® water after electrotransfer to remove any residual SDS carried over from the gel. Be sure to dry the blot completely prior to starting any detection protocol.
	Membrane was wet in methanol prior to the immunodetection	Do not pre-wet the membrane.
	Membrane wasn't completely dry prior to the immunodetection	Make sure the membrane is completely dry prior to starting the procedure. $\protect\p$
Non-specific binding	Primary antibody concentration too high	Increase primary antibody dilution.
	Secondary antibody concentration too high	Increase secondary antibody dilution.
	Antigen concentration too high	Decrease amount of protein loaded on the gel.
Reverse images on film (white bands on dark background)	Too much HRP-conjugated secondary antibody	Reduce concentration of secondary HRP-conjugated antibody.
Poor detec- tion of small proteins	Small proteins are masked by large blocking molecules such as BSA	Consider casein or a low molecular weight polyvinylpyrrolidone (PVP).
		Surfactants such as Tween® and Triton® X-100 may have to be minimized.
		Avoid excessive incubation times with antibody and wash solution.
Fluorescent detection		
High overall background	High background fluorescence from the blotting membrane	Use Immobilon®-FL PVDF blotting membrane.
Multiplexing problems	Experimental design	The two antibodies must be derived from different host species so that they can be differentiated by secondary antibodies of different specificities. Before combining the two primary antibodies, test the banding pattern on separate blots to determine where bands will appear. Use cross-adsorbed secondary antibodies in two-color detection.
Speckled background	Dust/powder particles on the surface of the blot	Handle blots with powder-free gloves and clean surface of the scanner.
Low signal	Wet blot	Drying the blot may enhance signal strength. The blot can be scanned after re-wetting. Do not wrap the blot in plastic/Saran wrap while scanning.
	Blot photo-bleached	While fluorescent dyes usually provide long-lasting stable signal some fluorescent dyes can be easily photo-bleached. To prevent photo-bleaching, protect the membrane from light during secondary antibody incubations and washes, and until the membrane is ready to be scanned. Store developed blots in the dark for subsequent imaging.
	Wrong excitation wavelength or emission filter	Follow dye manufacturer's instructions for blot imaging.

Timeless Recipes and Solutions for Blotting Success

Standard recipes for Western blotting

200 mM Tris 1500 mM NaCl

For 1 L:

24 g Tris base (formula weight: 121.1 g) 88 g NaCl (formula weight: 58.4 g) Dissolve in 900 mL Milli-Q® water pH to 7.6 with 12 N HCl Add Milli-Q® water to a final volume of 1 L

1X solution: mix 1 part of the 10X solution with 9 parts Milli-Q® water and adjust pH to 7.6.

For 1 L:

100 mL of TBS 10X 900 mL of Milli-Q® water 1 mL Tween®-20 detergent

4X SDS-PAGE sample loading

1.5 mL of 1 M Tris-HCl pH 6.8 3 mL of 1 M DTT (dithiothreitol) 0.6 g of SDS (sodium dodecyl sulfate) 0.03 g of bromophenol blue 2.4 mL of glycerol Bring final volume to 7.5 mL with Milli-Q® water If solution is orange/yellow in color, add 1 drop of 5 M NaOH to adjust pH Make 500 µL aliquots and store at -20°C

SDS-PAGE gel making buffer 1.5 M Tris-HCl (for separating gel)

118.2 g of Tris-HCl, Add 450 mL Milli-Q® water and adjust pH to 8.8 Add Milli-Q[®] water to final volume 500 mL

Filter and degas

for stacking gel)

78.8 g of Tris-HCl Add 450 mL Milli-Q® water and a djust pH to 6.8 Add Milli-Q® water to final volume 500 mL Filter and degas

SDS-PAGE 10X gel running buffer

60 g Tris base (248 mM) 288 g glycine (1.92 M) 20 g SDS (1% w/v) Milli-Q® water to final volume 2 L No need to pH, filter, or degas Dilute to 1X for running SDS-PAGE gels

81.8 g NaCl (1.4 M) 20.1 g KCl (270 mM) 14.2 g Na₂HPO₄ (100 mM) 2.45 g KH₂PO₄ (18 mM) . Add Milli-Q® water to final volume of 1 L

Transfer buffer 10X 15.2 g Tris base 72.1 g glycine 5.0 g SDS Milli-Q® water to final volume 500 mL

50 mL 10X transfer buffer 100 mL methanol Milli-Q® water to final volume 500 mL

1.25 g Coomassie blue R-250 225 mL methanol 225 mL Milli-Q® water 50 mL glacial acetic acid

SDS-PAGE destaining solution

300 mL methanol (30%) 100 mL acetic acid (10%) 600 mL Milli-Q® water

Recipes for TruPAGE™ Precast Gel System

179.0 g triethanolamine 143.3 g tricine 20 g SDS Milli-Q® water to final volume 1.0 L The pH should be between 8.2-8.3 at 25 °C.

20X TruPAGE™ Tris-MOPS SDS Express Running Buffer

145.2 g Tris base 143.3 g MOPS 20 g SDS Milli-Q® water to final volume 1.0 L The pH should be between 8.2-8.3 at 25 °C NOTE: Antioxidant (5 mM sodium bisulfite) is required in the inner chamber if using this buffer.

4.0 g glycerol 0.40 g lithium dodecyl sulfate 1.2 g triethanolamine 0.40 g Ficoll® 400 2.5 mg Phenol Red 2.5 mg Brilliant Blue G250 7.0 mg EDTA Milli-Q® water to final volume 10 mL The pH should be between 7.7-7.8 at 25 °C. Dissolve triethanolamine (0.8 M) and pH to 7.6 before adding other reagents.

4.2 a Sodium Bisulfite Milli-Q® water to final volume 10 mL

20X TruPAGE™ Transfer Buffer 30.3 g Tris base 144.1 g glycine Milli-Q® water to final volume 1.0 L.

38.6 mg DTT Milli-Q® water to final volume 1.0 mL

Electrophoresis

Description	Cat. No.
Gel Casting Reagents	
Ammonium persulfate (APS), for molecular biology, for electrophoresis, ≥98%	A3678
N,N,N',N'-Tetramethylethylenediamine (TEMED), BioReagent, suitable for electrophoresis, ~99%	T9281
SDS Gel Preparation Kit	8091
Reducing Agents	
2-Mercaptoethanol (BME)	63689
DL-Dithiothreitol (DTT),BioUltra, for molecular biology, 1 M in H ₂ O	43816
5-Sulfosalicylic acid dihydrate, for electrophoresis, ≥99%	S3147
Tris(2-carboxyethyl)phosphine hydrochloride, BioUltra, for electrophoresis, SDS-PAGE tested	68957

Transfer

SNAP i.d.® 2.0 System - MultiBlot (4.5 x 8.4 cm)	SNAP2MB3
SNAP i.d.® 2.0 System - Mini and Midi (7.5 x 8.4 cm and 8.5 x 13.5 cm)	SNAP2MM
SNAP i.d.® 2.0 System - Mini and MultiBlot (7.5 x 8.4 cm and 4.5 x 8.4 cm)	SNAP2MB1
SNAP i.d.® 2.0 System - Midi and MultiBlot (8.5 x 13.5 cm and 4.5 x 8.4 cm)	SNAP2MB2
SNAP i.d.® 2.0 consumables	
SNAP i.d.® 2.0 Mini Blot Holders (7.5 x 8.4 cm) 100/pk	SNAP2BHMN0100
SNAP i.d.® 2.0 Midi Blot Holders (8.5 x 13.5 cm) 100/pk	SNAP2BHMD0100
SNAP i.d.® 2.0 MultiBlot Holders (4.5 x 8.4 cm) 50/pk	SNAP2BHMB050
SNAP i.d.® 2.0 accessories	
SNAP i.d.® 2.0 Antibody Collection Tray 20/pk	SNAPABTR
SNAP i.d.® 2.0 Blot Roller 1/pk	SNAP2RL
SNAP i.d.® 2.0 Mini Blot Holding Frames (double pack) 2/pk	SNAP2FRMN02
SNAP i.d.® 2.0 Midi Blot Holding Frames (double pack) 2/pk	SNAP2FRMD02
SNAP i.d.® 2.0 Mini Blot Holding Frame (single pack) 1/pk	SNAP2FRMN01
SNAP i.d.® 2.0 Midi Blot Holding Frame (single pack) 1/pk	SNAP2FRMD01
SNAP i.d.® 2.0 MultiBlot Frame (single pack) 1/pk	SNAP2FRMB01
Signal enhancer reagents	
Immobilon® Signal Enhancer for Immunodetection	WBSH0500

Blocking & Antibody Addition

Description	Cat. No.
Blocking buffers and reagents	
Immobilon® Block-CH for HRP chemiluminescent applications	WBAVDCH01
Immobilon® Block-FL for fluorescent applications	WBAVDFL01
Immobilon® Block-PO for use with phosphospecific antibodies	WBAVDP001
Western Blocker™ Solution, for HRP detection systems	W0138
Bovine Serum Albumin, heat shock fraction, protease free, fatty acid free, essentially globulin free, pH 7, ≥98%	A7030
Bovine Serum Albumin, heat shock fraction, pH 7, ≥98%	A7906
Gelatin blocking buffer, powder blend	G7663
Phosphate buffered saline, 10x concentrate, BioPerformance Certified, suitable for cell culture	P5493
Phosphate buffered saline, dry powder, pH 7.4, contains 3% nonfat milk	P2194
Phosphate buffered saline, pH 7.4, contains BSA, powder	P3688
Phosphate buffered saline, powder, pH 7.4	P3813
Tris Buffered Saline, with BSA, pH 8.0, powder	T6789
Wash buffers	
Phosphate buffered saline, BioUltra, pH 7.4 (in solution), contains TWEEN 20, tablets	08057
Phosphate buffered saline, pH 7.4, contains TWEEN® 20, dry powder	P3563
ris Buffered Saline, pH 8.0, powder	T6664
ris buffered saline with TWEEN® 20, BioUltra, tablets (for 500 mL), pH 7.6	91414
ris Buffered Saline, with TWEEN® 20, pH 8.0, powder	T9039
Peroxidase conjugates	
Anti-Mouse IgG (Fab specific)-Peroxidase antibody produced in goat, affinity isolated antibody buffered aqueous solution	A3682
anti-Mouse IgG (Fab specific)-Peroxidase antibody produced in goat, affinity isolated antibody buffered aqueous solution	A9917
anti-Mouse IgG (Fc specific)-Peroxidase antibody produced in goat, affinity isolated antibody	A0168
nti-Mouse IgG (Fc specific)-Peroxidase antibody produced in goat, affinity isolated antibody buffered aqueous solution	A2554
anti-Mouse IgG (whole molecule)-Peroxidase antibody produced in rabbit, IgG fraction of antiserum buffered aqueous solution	A9044
nti-Rabbit IgG (whole molecule)-Peroxidase antibody produced in goat, affinity isolated antibody	A0545
widin-Peroxidase, lyophilized powder	A3151
anti-Goat IgG (whole molecule)-Peroxidase antibody produced in rabbit, affinity isolated antibody, buffered aqueous solution	A5420
nti-Mouse IgG (whole molecule)-Peroxidase antibody produced in goat, affinity isolated antibody buffered aqueous solution	A4416
anti-Rabbit IgG (whole molecule)-Peroxidase antibody produced in goat, affinity isolated antibody buffered aqueous solution	A6154
Anti-Goat IgG Antibody, HRP conjugate; produced in rabbit; Purified rabbit IgG conjugated to horseradish peroxidase in buffer containing 0.01 M Sodium Phosphate, 0.15 M NaCl, pH 7.1 with 15 mg/mL BSA and 0.01% thimerosal. Lyophilized.	AP106P
Inti-Rabbit IgG Antibody, HRP-conjugate; produced in rabbit; Goat polyclonal conjugated with horseradish peroxidase IgG in buffer containing 50% torage buffer 0.02 M potassium phosphate, 0.15 M NaCl, pH 7.2, 10 mg/mL BSA, 0.01% (w/v) gentamicin sulfate and 50% glycerol. Lyophilized.	12-348
Anti-Mouse IgG Antibody, HRP conjugate; produced in goat; Purified goat polyclonal IgG in buffer containing conjugated to horseradish peroxidase yophilized from 0.02 M Potassium Phosphate, 0.15 M NaCl, pH 7.2, .0 mg/mL BSA, and 0.01% gentamicin sulfate.	12-349
Anti-Mouse IgG Antibody, (H+L) HRP conjugate; produced in goat; Purified Goat IgG in buffer containing liquid in PBS, pH 7.1 with 15 mg/mL BSA and 0.01% thimerosal.	AP308P
nti-Rabbit light chain, HRP conjugate Antibody; produced in mouse; Purified from antiserum by chromatographic procedures. Lyophilized in 0.01M iodium Phosphate, 0.25M NaCl, pH 7.6. 15 mg/mL BSA as stabilizer.	MAB201P
nti-Mouse light chain Antibody, HRP conjugate; produced in goat; Lyophilized in 0.01M Sodium Phosphate, .25M NaCl, pH 7.6. 15 mg/mL BSA as stabilizer. Purified by immunoaffinity chromatography.	AP200P
lurophore conjugates	
ECL Plex™ G-A-M IgG, Cy®3, GE Healthcare, PA43009, pack of 150 µg	GEPA43009
ECL Plex™ G-A-M IgG, Cy®5, GE Healthcare, PA45010, pack of 600 µg	GEPA45010
ECL Plex™ Gar IgG Cy®3, GE Healthcare, 28-9011-06, pack of 150 µg	GE28-9011-06
ECL Plex™ G-A-R IgG, Cy®5, GE Healthcare, PA45011, pack of 150 μg	GEPA45011

Blot Stripping Reagents

Description	Cat. No.
ReBlot™ Plus Mild Antibody Stripping Solution, 10 x 50 mL	2502
ReBlot™ Plus Strong Antibody Stripping Solution, 10 x 50 mL	2504
Blot Restore Membrane Rejuvination Kit, 10x	2520-M

Detection

Description	Cat. No.
Immobilon® Western Chemiluminescent HRP Substrate	
2 x 25 mL	WBKLS0050
2 x 50 mL	WBKLS0100
2 x 250 mL	WBKLS0500
Immobilon® ECL Ultra Western HRP Substrate	
2 x 10 mL	WBULS0020
2 x 50 mL	WBULS0100
2 x 250 mL	WBULS0500
Immobilon® Classico Western HRP Substrate	
20 mL	WBLUC0020
100 mL	WBLUC0100
500 mL	WBLUC0500
Immobilon® Crescendo Western HRP Substrate	
20 mL	WBLUR0020
100 mL	WBLUR0100
500 mL	WBLUR0500
Immobilon® Forte Western HRP Substrate	
20 mL	WBLUF0020
100 mL	WBLUF0100
500 mL	WBLUF0500
Amersham ECL Western Blotting Detection Reagent	
Amersham™ ECL™ Western Blotting Reagent Pack GE Healthcare, RPN2124, pack of 1 kit	GERPN2124
ECL™ Western Blotting Analysis System GE Healthcare, RPN2108	GERPN2108
ECL™ Western Blotting Detection Reagents GE Healthcare, RPN2209	GERPN2209
ECL™ Western Blotting Reagents GE Healthcare, RPN2106	GERPN2106
ECL™ Western Blotting Reagents GE Healthcare, RPN2134	GERPN2134
ECL™ Western Blotting Reagents GE Healthcare, RPN2109	GERPN2109
ECL™ Start Western Blotting Reagent GE Healthcare, RPN2109	GERPN3243
ECL™ Start Western Blotting Reagent GE Healthcare, RPN2109	GERPN3244
Amersham ECL Prime Western Blotting Detection Reagent	
ECL™ Prime Western Blotting System GE Healthcare, RPN2232	GERPN2232
ECL™ Prime Western Blotting Detection Reagent GE Healthcare, RPN2236	GERPN2236
Amersham ECL Select Western Blotting Detection Reagent	
ECL™ Select Western Blotting Detection Reagent GE Healthcare, RPN2235	GERPN2235
Detection Films	
Hyperfilm™ ECL™, W x L 18 cm x 24 cm, pack of 100 ea	GE28-9068-37
Hyperfilm™ MP, W x L 8 in. x 10 in., pack of 50 ea	GE28-9068-45
Chromogenic Substrates	
3,3',5,5'-Tetramethylbenzidine (TMB) Liquid Substrate System for Membranes, ready-to-use solution	T0565
3,3'-Diaminobenzidine (DAB) Enhanced Liquid Substrate System tetrahydrochloride, for Membrane Applications	D6815

Accessories

Description	Cat. No.
Scienceware [®] gel incubating tray W \times L 1.6 cm (0.63 in.) \times 11.5 cm (4.5 in.)	BAF451000000-5EA
Scienceware® gel incubating tray W \times L 9.0 cm (3.5 in.) \times 9.0 cm (3.5 in.)	BAF451000001-5EA
Scienceware® gel incubating tray W \times L 16.5 cm (6.5 in.) \times 16.5 cm (6.5 in.)	BAF451000002-5EA
Scienceware® electrophoresis plate rack, polypropylene	E1028-1EA
Gel Handler™ gel support	Z376957-1PAK

Don't just lyse your sample,

stabilyse it!

Twofold Protection: Stabilyser™ Protein & RNA Stabilization Reagent

Maintain nucleic acids and functional proteins with Stabilyser™ reagent, the ONLY reagent that protects the integrity of nucleic acids AND active protein in one uniform lysate mixture. Now, you can stabilize complete, uniform tissue homogenates providing sample-to-sample comparability.

- Maintain functionally active protein & nucleic acids from the same tissue samples
- Protection from multiple freeze/thaw cycles for future detection needs
- Archive tissue samples if future analyte needs change

Don't just lyse your sample, **stabilyse** it – request your sample today! **SigmaAldrich.com/stabilyser**

The life science business of Merck operates as MilliporeSigma in the U.S. and Canada.
